ABOUT

Turn confusing problems into screens that solve problems.

I'm Bolaji. I began my product design career in 2022 at Sheda House Academy. I design in Figma, from user personas and wireframes all the way to full prototypes, and I code the front end too, so I'm always thinking about how things will actually get built.

How I work

1 **Start with the person**

Before I draw anything, I figure out who I'm designing for and what they need.

2 **Plan the journey**

I sketch the user flow and wireframes first, so the path is clear before I add any colour.

3 **Make it clickable**

I build a prototype in Figma so people can try it and tell me what's confusing.

4 **Hand it over**

I keep everything consistent with a design system, and I can code the front end myself.

CASE STUDY 01

Ingress

Finding events shouldn't depend on who you know.

My role

Lead UX Designer, Associate UI Designer

When

July to August 2023

Where

Sheda House Academy

What I learned

Ingress was my first time leading a design team, and I learned that being the lead isn't only about the designs. I was too lenient with my teammates on deadlines, and that stretched the project longer than it should have. Next time I'll set clear deadlines early and check in often, while staying kind about it.

The problem

People mostly hear about events through friends. If you don't have a big circle, you miss out, and even if you do, you can be too busy to attend something important.

I wanted a place where young people can find events on their own, get tickets easily, and watch a stream when they can't be there.

My role

I was the Lead UX Designer and Associate UI Designer. I ran the research, set up the user flow, designed the screens, and guided the other designers so the product felt consistent from start to finish.

The process

1 **Research**

I spoke with people one-on-one, looked at other event apps, and sent out Google Forms to hear from more people.

2 **User flow**

I mapped how someone goes from finding an event to getting in.

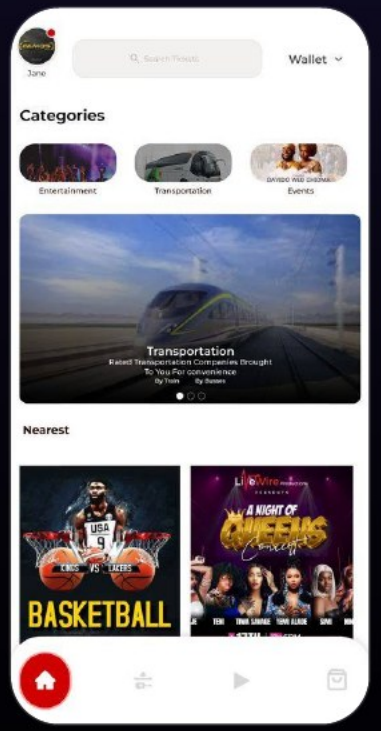

3 **Wireframes**

I turned the flow into simple screens before adding any colour.

4 **Prototype**

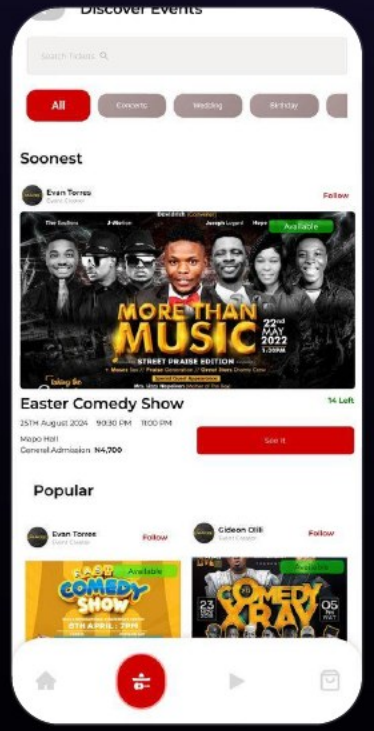

I built a clickable prototype so the idea could be tried out.

Ingress THE SCREENS

Home

Search for tickets, browse categories, and see the events nearest to you.

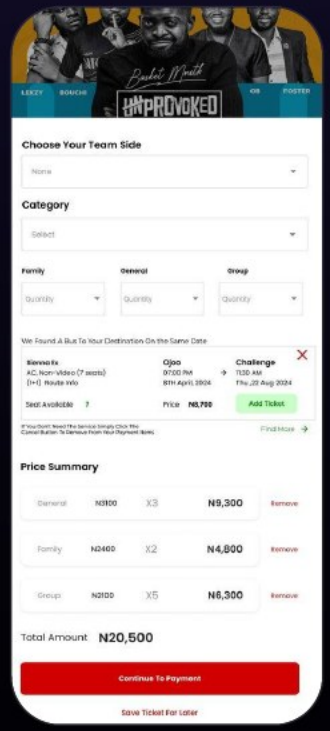

Discover events

Filter by type, like concerts, weddings, and birthdays, and follow the creators you like.

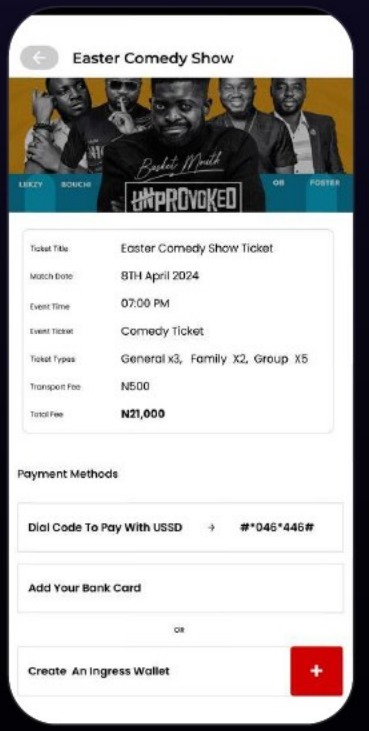

Event details

Date, place, price, and a clear Buy Ticket button. Events that stream live are marked.

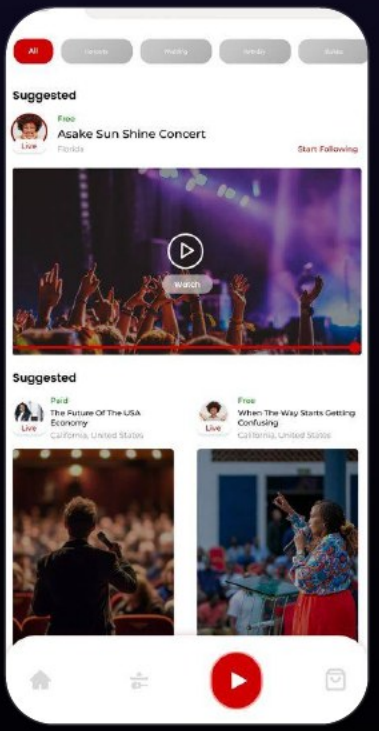

Choose tickets

Pick family, general, or group tickets and see the price add up. It even suggests a bus to the event.

Payment

Pay by USSD code, bank card, or an Ingress wallet, so people without a card can still buy.

Live streams

Can't make it? Watch a stream of the event and follow the creators you like.

CASE STUDY 02

Vital-Plate

Food made the way you actually want it.

My role

UI/UX Designer

When

October to November 2022

Where

Sheda House Academy, Oyo State

What I learned

Vital-Plate is where my journey into UX design began. It taught me the basics of user interface design and prototyping, and how to build a user persona.

The goal

The main goal was to help buyers get the food they actually crave, made the way they like it, instead of just picking a dish and hoping for the best.

My role

I designed the user interface and the interactive prototype for Vital-Plate during my product design training at Sheda House Academy.

The process

1 **Know the buyer**

I created a user persona to keep the buyer in mind while designing.

2 **Design the ordering**

I designed the screens for the whole order: finding a meal, rechecking the list, choosing delivery and payment, and tracking the order.

3 **Prototype**

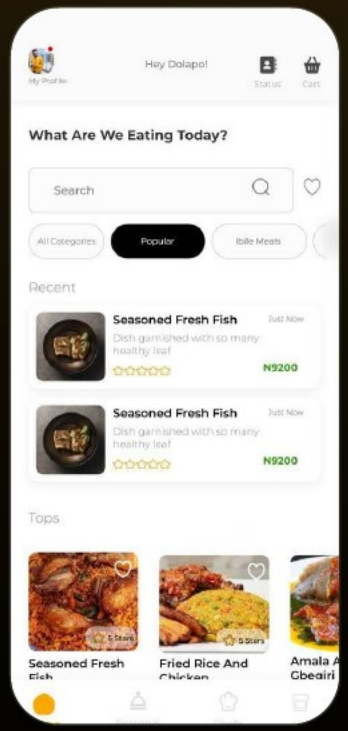

I built an interactive prototype so the order could be tried from start to finish.

Vital-Plate THE SCREENS

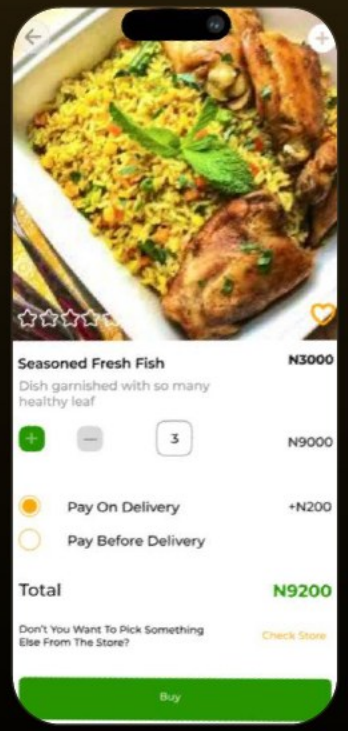

Welcome

The welcome screen with the Vital-Plate logo.

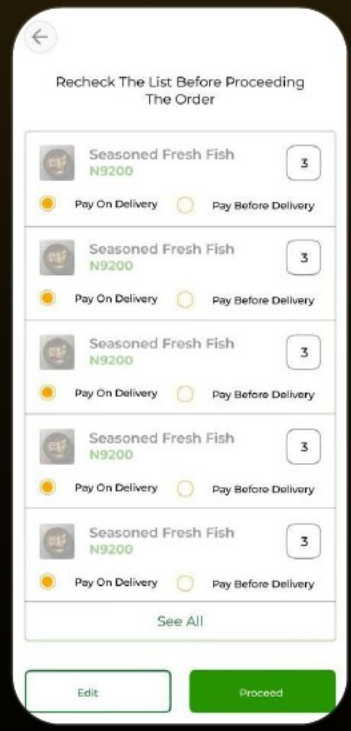

Home

Search for meals, filter by category, and see recent orders and top picks. The bottom bar has Home, Personal, Chefs, and Mart.

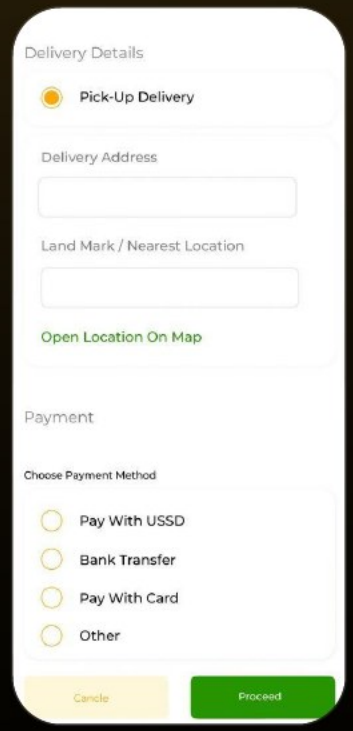

Dish

Pick how many, choose pay on delivery or before delivery, see the total, and tap Buy.

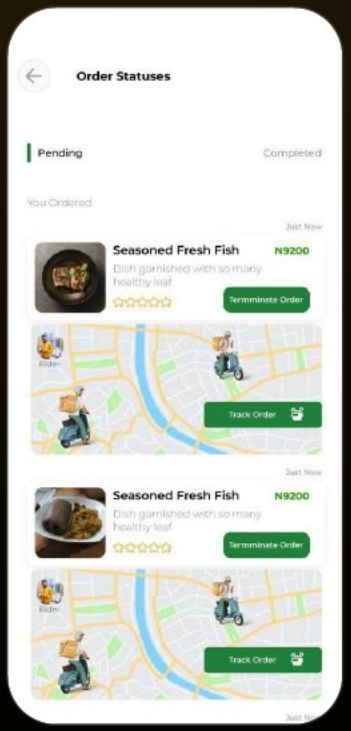

Recheck the order

Before going on, buyers recheck the list, change quantities, or edit.

Delivery and payment

Add an address and landmark, open the location on a map, then pay by USSD, bank transfer, card, or another way.

Track the order

Pending orders show the rider on a map, with Track Order and Terminate Order buttons.

CASE STUDY 03

Digi-Learners

Turning the phone into a study tool.

My role

UI/UX Designer

When

January to February 2023

Where

Sheda House Academy, Oyo State

What I learned

Digi-Learners helped me get better at the basics: setting up a user flow and wireframes, using colour with care, and keeping screens clean with good alignment and white space.

The problem

Students always have their phone with them, but it can pull them away from their work. I wanted a way to make the phone as productive as it can be for studying.

My role

I designed Digi-Learners during my product design training at Sheda House Academy. I did the research, decided which features students needed, and designed the screens.

The process

1 **Research**

I looked into ways of studying well and what students need to learn.

2 **Put it all in one place**

I picked the features that would help most and made them all available in one app.

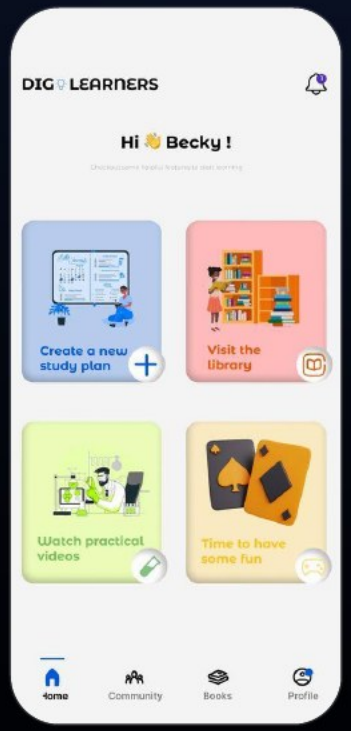

3 **Protect the focus**

Once a student is inside the app, Do Not Disturb turns on, so notifications don't pull them away.

4 **Design**

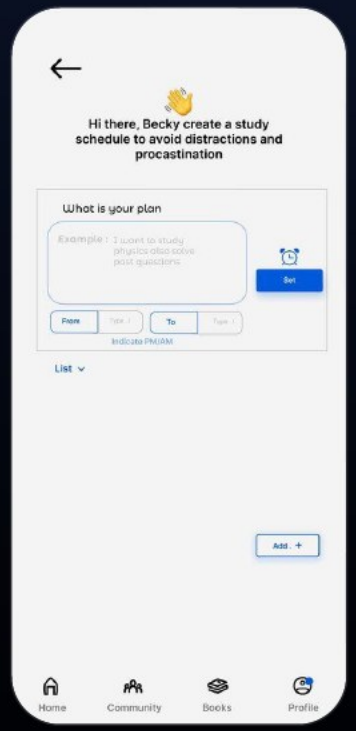

I mapped the user flow, built wireframes, then worked on colour, alignment, and white space to keep the screens clean.

Digi-Learners THE SCREENS

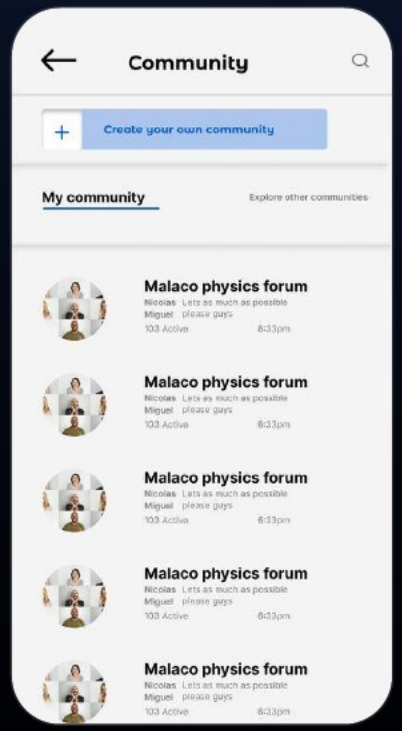

Home

Four ways in: make a study plan, visit the library, watch practical videos, or take a break.

Study plan

Write what you plan to study, set the from and to times, and set a reminder.

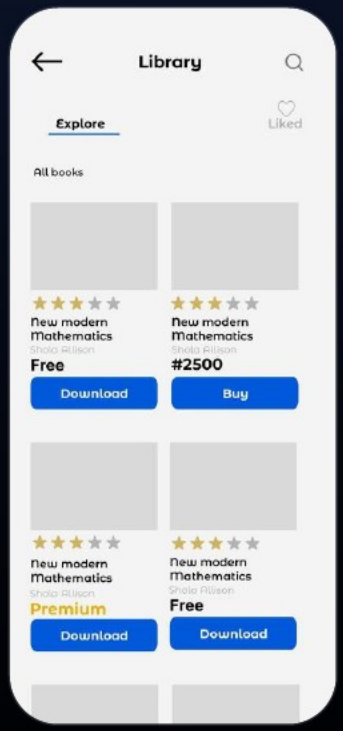

Community

Join a community for group reading, or create your own.

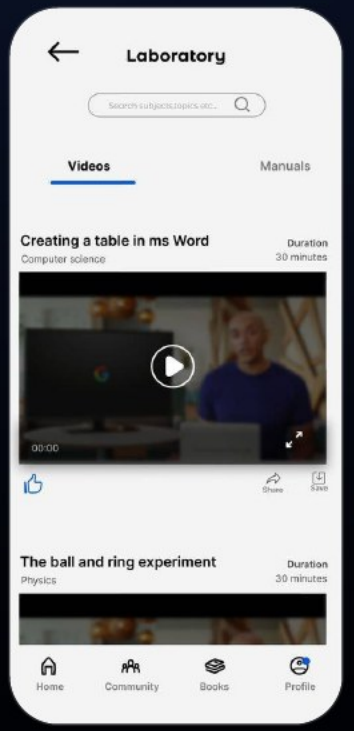

Group chat

A study group can talk things through, with voice and video call buttons at the top.

Library

Browse books to download, free or paid, and like the ones you want.

Practical videos

Short videos by subject, which help students learn quickly. Share or save the ones you like.

CASE STUDY 04

E-Health

Making healthcare feel simple from the first click.

What it is

A website with Home and About pages

My role

Product designer

When

March 2025

Where

Fireswitch, as an intern

What I learned

This project taught me total responsibility. As an intern at Fireswitch, I was trusted with the E-Health website from start to finish, so there was no one else to hand a decision to. The layout, the colours, the wording, the pictures and the way each section leads a visitor to sign up were all mine to get right. Owning the whole thing also meant owning the small details, from the spelling in the copy to whether every section had a clear next step. It showed me that a design isn't finished when it looks good. It's finished when I've checked every part of it and I'm willing to stand behind it. Next time I'll build time into the schedule for a slow, careful review of my own work before anyone else sees it.

The problem

Getting care can mean long waits, trouble finding the right specialist, medical records scattered between clinics, and a separate trip to the pharmacy. E-Health is a platform built to fix that.

A platform like this only works if people understand it quickly and trust it with something as personal as their health. That was the job of the website.

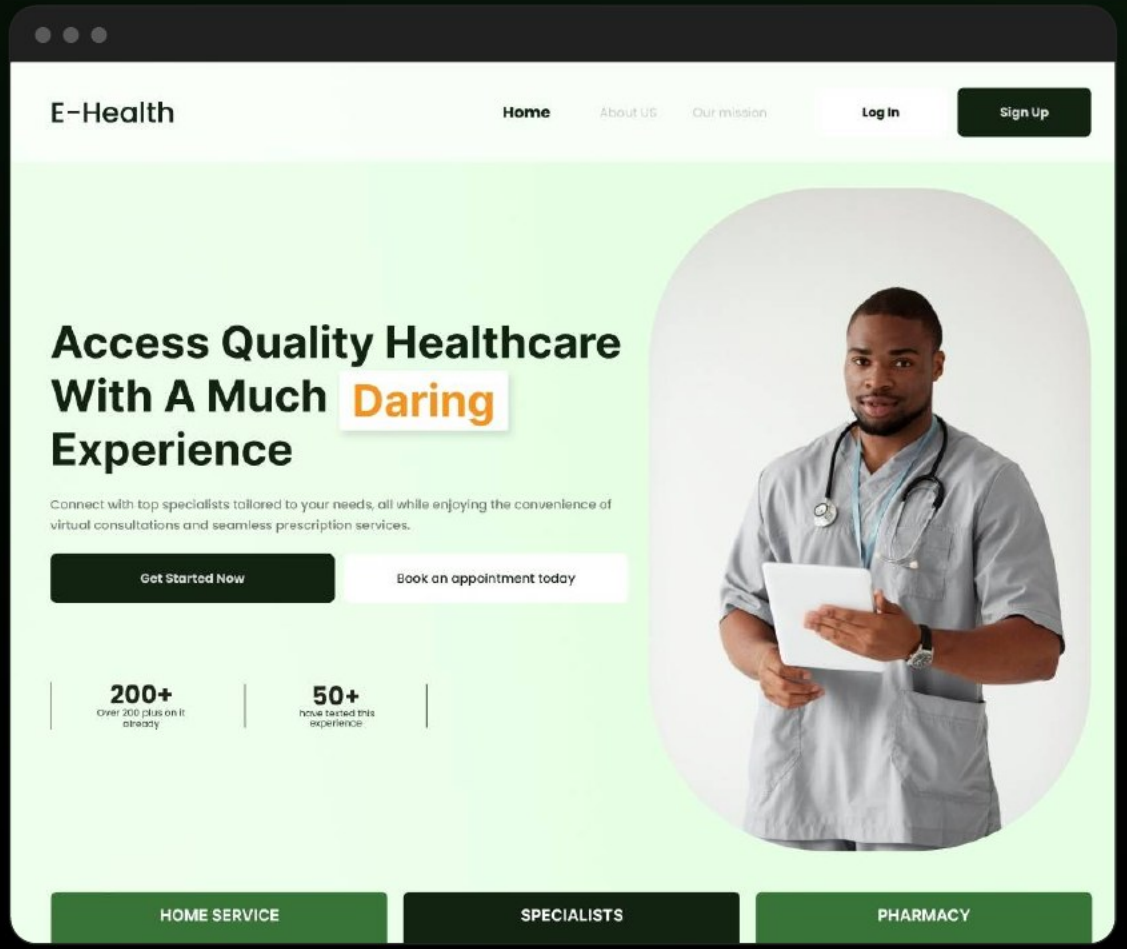

My role

I designed the E-Health website: the Home page and the About page, from the layout and colour to how each section leads a visitor towards signing up.

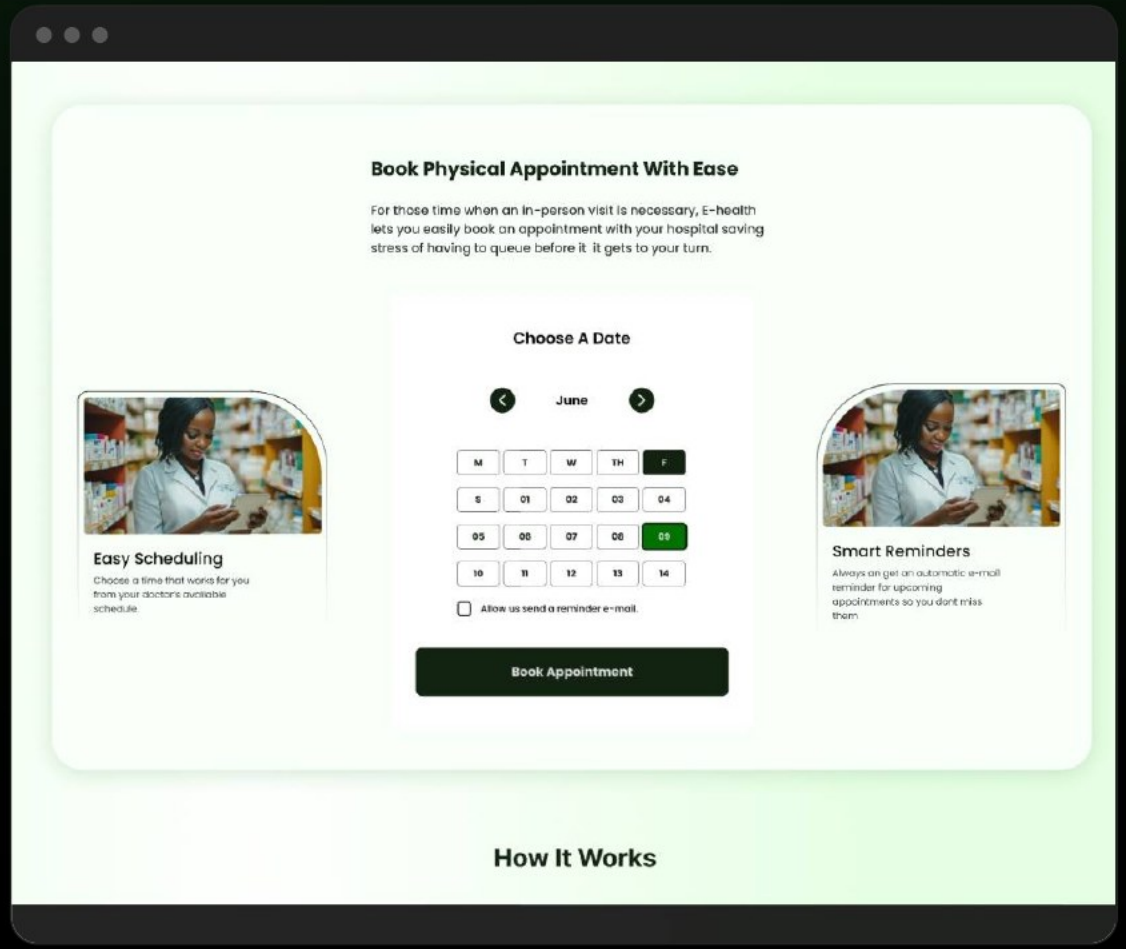

What I focused on

1. **A calm, healthy look**
   Soft mint backgrounds, deep green and charcoal sections, and photos of real doctors and patients. One orange accent is saved for the things I want people to notice and tap.
2. **One idea per section**
   The Home page takes it one step at a time: find a doctor, share your health history, order your prescription, book a visit. Each gets its own card with small picture tiles.
3. **Show how it works**
   A four-step "How it works" block (create a profile, connect with a specialist, get a prescription, book a follow-up) so a new visitor can picture the whole journey.
4. **Earn trust**
   The About page explains the vision, the mission and why E-Health started, and the Home page ends with patient testimonials.
5. **Always a next step**
   "Get Started Now", "Book an appointment today", "Register Now For Free", plus Log in and Sign up, appear again and again so nobody has to hunt for how to begin.

E-Health THE HOME PAGE

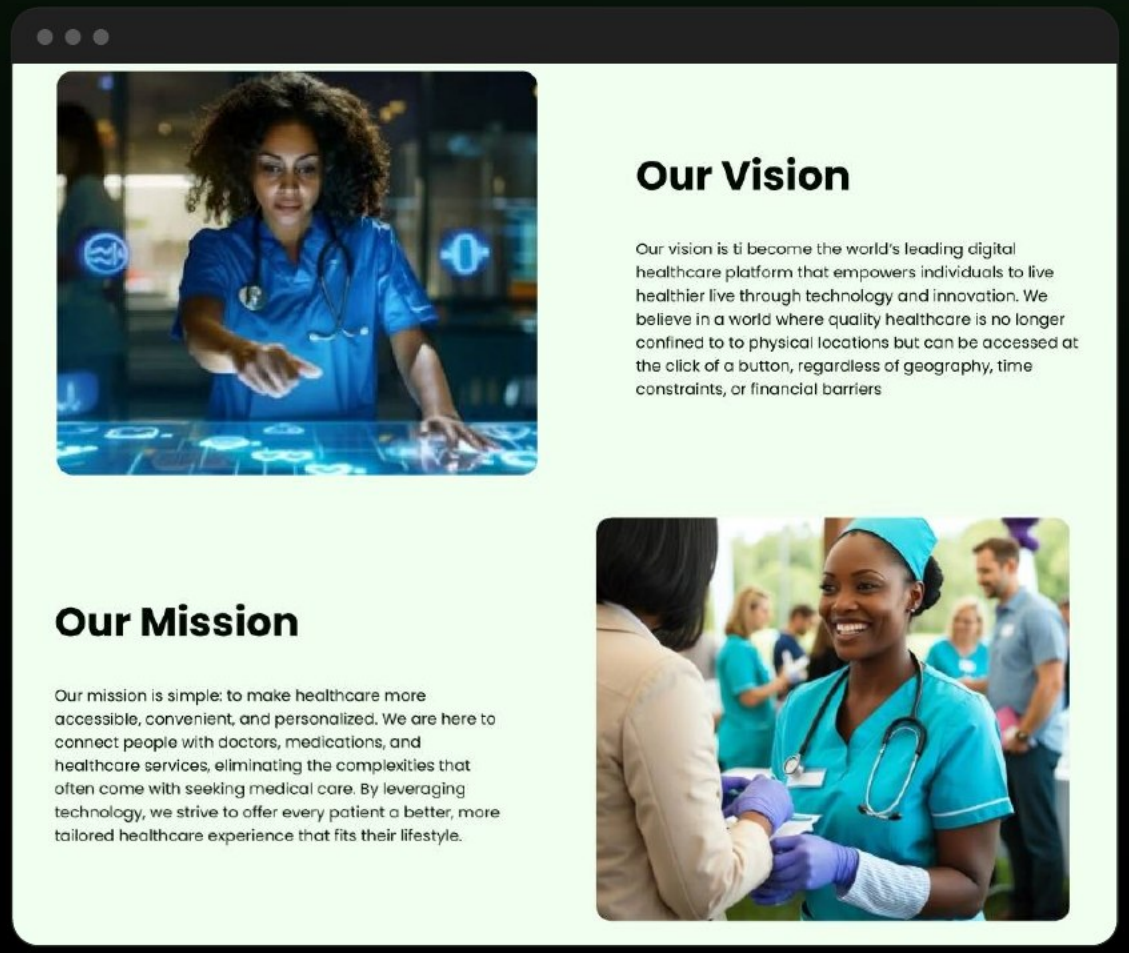

Hero — The first thing a visitor sees: the promise, two clear buttons and the three main services.

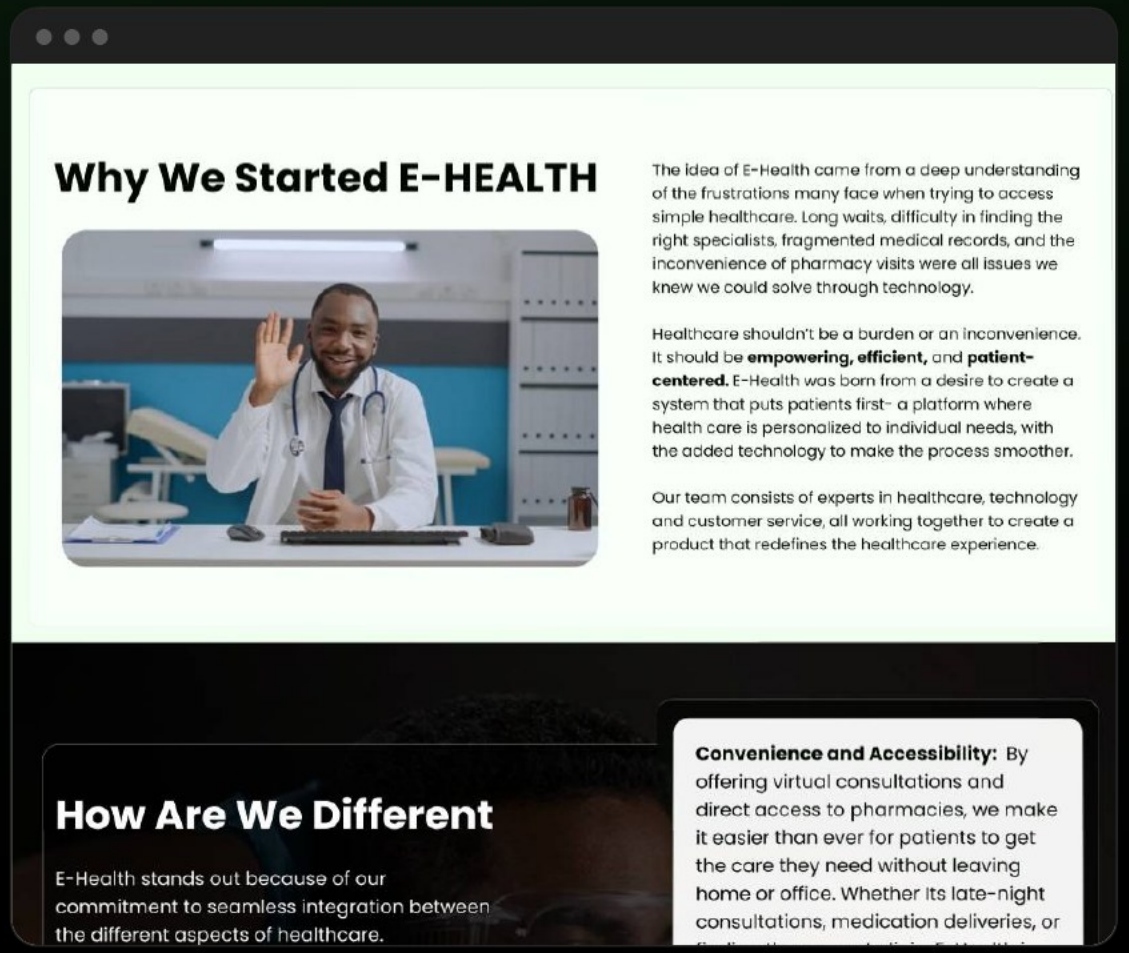

Book a visit — A calendar to book an in-person visit, with reminders so patients never miss it.

E-Health THE ABOUT PAGE

Vision & mission — Vision and mission, in plain words with real people in the pictures.

Why we started — Why E-Health started: long waits, scattered records and the pharmacy trip.

Qualifications

Education

B.Sc. Mechanical Engineering
Obafemi Awolowo University, Ile-Ife

October 2023 to present · Current student

Product Design
Sheda House Academy, Oyo State

October 2022 to August 2023

Certificate

Introduction to User Interface Design
University of Minnesota, on Coursera

2023

I took this course during my training at Sheda House Academy to stay a few steps ahead of what I was being taught. It helped me learn much of the theory behind user interface design.

Languages

English
Fluent

Skills

Design

UI/UX design · Wireframing · Prototyping · Interaction design · Design systems · User flows

Development

Front-end development (intermediate)
